PROJECT REVIEW 2

Implementation, Integration and Progress Review

Maximum Marks: 10 | Team Size: 4 Students

Course Code / Title	
Team Number	
Project ID and Title	
Review Date	
Faculty / Evaluator	

Purpose: To verify that the team has converted the approved design into measurable implementation, integrated the major modules, tested the developing system, corrected Review 1 observations, and prepared a realistic plan for final completion.

1. Purpose and Expected Outcome of Review 2

Review 2 is an implementation-focused review. A presentation consisting only of revised diagrams, literature survey or future plans is not sufficient. The team must demonstrate working technical output and explain how the completed modules connect to the approved project objectives. Every member must present and demonstrate evidence of the module or technical responsibility assigned to that member.

- Closure of corrections and action items communicated during Review 1.
- Working implementation of the major front-end, analysis, optimization, code-generation, runtime, visualisation or supporting modules applicable to the project.
- An integrated prototype showing meaningful end-to-end or module-to-module execution.
- Repository evidence with member-wise commits, readable code structure and updated documentation.
- Testing evidence covering valid, invalid, boundary and representative project-specific inputs.
- Identification of implementation defects, technical risks and the plan for completing Review 3 deliverables.
- Clear evidence that every member understands both the assigned module and the complete project workflow.

2. Review 2 Evaluation Components – 10 Marks

Important: Marks are awarded individually. A team may demonstrate a satisfactory prototype, but a student can receive a lower mark when the student cannot explain the claimed implementation, has no verifiable contribution, or is unable to answer questions concerning module interfaces and project integration.

Component	Evidence to Be Presented	Marks
1. Review 1 Corrections and Progress against Plan	Review 1 feedback and action-item closure; comparison of planned versus completed work; justified changes in scope, tools, architecture or timeline.	1.0
2. Core Module Implementation and Technical Depth	Working implementation of major project modules; algorithms, parser/IR/analysis/optimization logic; source-code explanation; handling of important conditions and technical decisions.	2.5
3. Integration and Functional Prototype	Interaction between modules; end-to-end or partial integrated execution; input-output flow; interface/API/data-format compatibility; demonstrable functional workflow.	1.5
4. Testing, Debugging and Correctness Evidence	Test cases with expected and actual output; valid, invalid and boundary tests; defect log; debugging evidence; correctness checks and preliminary performance observations.	1.5

Component	Evidence to Be Presented	Marks
5. Code Quality, Repository and Documentation	Modular source code; naming and comments; repository history; README/build instructions; member-wise commits; updated architecture, module documentation and traceability.	1.0
6. Completion Plan and Risk Handling	Pending work; revised week-wise plan; dependencies; integration risks; mitigation steps; clear Review 3 targets and ownership.	0.5
7. Demonstration, Presentation, Individual Contribution and Viva	Live technical demonstration; clarity; equal participation; explanation of personal work; understanding of the complete system; response to technical and project-management questions.	2.0
Total		**10.0**

3. Member-Wise Presentation Breakdown for a Team of Four

Recommended total presentation and demonstration duration: 15–18 minutes, followed by 6–10 minutes of viva. The live demonstration should occupy at least 6 minutes of the allotted presentation time.

Presentation rule: Every member must explain and demonstrate a technical contribution. Documentation preparation, slide preparation or speaking alone cannot be treated as the member's complete contribution. A member claiming a module must be able to open the relevant source files, explain the logic, execute the module and discuss its test cases.

Presenter	Recommended Time	Content to Be Presented	Mandatory Personal Evidence
Member 1 – Project Lead / Integration Coordinator	3–4 minutes	Summarise Review 1 corrections, updated objectives and architecture; report planned-versus-completed progress; explain integration status, dependencies and overall prototype workflow.	Closed-action list, progress tracker, integration diagram, repository evidence, revised milestone plan.
Member 2 – Core Module / Front-End Owner	3–4 minutes	Explain and demonstrate the first major technical module, such as lexer/parser, data acquisition, semantic analysis, front-end processing, type checking or equivalent project-specific component.	Source files and commits, sample input/output, algorithm explanation, unit tests and defect fixes.
Member 3 – Core Algorithm / Processing Owner	3–4 minutes	Explain and demonstrate the second major technical module, such as IR processing, optimization, data-flow analysis, code generation, VM/runtime logic, ML model or security analysis.	Source files and commits, pseudocode or transformation example, execution trace, tests and observed limitations.
Member 4 – Testing / Interface / Documentation Owner	3–4 minutes	Explain module integration, interface or visualisation work, automated/manual testing, defect tracking, repository organisation, build/run process and Review 3 completion plan.	Integrated build, test report, screenshots/logs, issue tracker, README, pending-task plan and evidence of technical support work.
All Members – Live Demo and Viva	6–10 minutes	All members must participate in the live demonstration and answer questions on their own module, module dependencies, inputs/outputs, failure cases, integration and the complete project.	Ability to execute the project, locate and explain code, justify design decisions, interpret results and identify remaining work.

4. Recommended Review 2. Presentation Structure

Recommended slide limit: 12–15 content slides. Source-code details, additional test cases, diagrams, logs and result tables may be kept as backup slides. The live execution should not be replaced by screenshots unless execution is impossible because of an approved infrastructure limitation.

Slide	Required Content	Primary Presenter
1	Project title, project ID, team number and member details	Member 1
2	Review 1 feedback, corrections completed and current objective status	Member 1
3	Updated architecture, modules, interfaces and overall workflow	Member 1
4	Planned versus completed work and implementation progress summary	Member 1

Slide	Required Content	Primary Presenter
5	Core Module 1: purpose, design, algorithm and source-code organisation	Member 2
6	Core Module 1: working demonstration, sample input/output and tests	Member 2
7	Core Module 2: purpose, design, algorithm and source-code organisation	Member 3
8	Core Module 2: working demonstration, sample input/output and tests	Member 3
9	Module integration, data exchange and end-to-end prototype execution	Members 1 & 4
10	Testing summary: valid, invalid, boundary and failure cases	Member 4
11	Defects found, debugging performed and current limitations	Member 4
12	Repository, member-wise contribution evidence and documentation status	Member 4
13	Pending tasks, risks, mitigation and Review 3 completion plan	Member 1
14	Expected final results and evaluation metrics	All Members
15	Key conclusion and readiness for final review	All Members

5. Review 2 Document to Be Submitted

The team should submit one consolidated Review 2 progress document, preferably in PDF format. It should update the Review 1 document rather than repeating it without implementation evidence. Recommended length: 8–15 pages excluding appendices and source-code listings.

Cover Page: Course, project ID/title, team number, member names/register numbers, review date and faculty name.

1. Review 1 Feedback and Compliance: Observation, action taken, owner, evidence and closure status.
2. Updated Abstract, Objectives and Scope: Changes from Review 1, with justification.
3. Updated Architecture and Module Interfaces: Components, data structures, formats, APIs and dependencies.
4. Implementation Progress Summary: Planned task, completed task, percentage/status, owner and evidence.
5. Module 1 Implementation: Design, algorithm, source-code structure, input/output and current limitations.
6. Module 2 Implementation: Design, algorithm, source-code structure, input/output and current limitations.
7. Integration / Prototype: Execution flow, integrated features, interface issues and screenshots or logs.
8. Testing and Debugging: Test-case table with expected result, actual result, pass/fail and corrective action.
9. Repository and Build Information: Repository link, branch strategy, folder structure, dependencies and run instructions.
10. Member-Wise Contribution Record: Technical tasks completed, commits/evidence, time period and next responsibility.
11. Risks, Issues and Pending Work: Severity, owner, mitigation and planned completion date.
12. Revised Timeline for Review 3: Remaining implementation, integration, evaluation, report and final demo tasks.
13. Preliminary Results: Correctness, performance, comparison, visualisation or sample transformation results, where applicable.
14. References and Appendix: Updated references, test logs, screenshots, issue tracker and contribution evidence.

6. Mandatory Review 2 Progress and Responsibility Matrix

Member	Assigned Technical Module	Work Completed for Review 2	Evidence / Commit / Demo	Pending Work for Review 3	Integration Dependency
Member 1					
Member 2					
Member 3					
Member 4					

Guideline: Evidence must identify the actual technical work performed. Entries such as “helped in coding”, “prepared PPT” or “did documentation” are insufficient unless accompanied by a specific module, test, interface, analysis, code section or measurable output.

7. Mandatory Evidence and Submission Checklist

- ☐ Review 2 presentation file following the prescribed structure.
- ☐ Updated Review 2 progress document with Review 1 corrections and implementation evidence.
- ☐ Working repository with readable folder structure and identifiable member contributions.
- ☐ Executable or demonstrable implementation of at least two major technical modules.
- ☐ Integrated prototype demonstrating meaningful module interaction.
- ☐ Test-case table containing valid, invalid, boundary and project-specific cases.
- ☐ Defect/issue log showing errors identified, owner, correction and current status.
- ☐ Updated architecture, interface/data-flow diagram and module descriptions.
- ☐ Build/run instructions and dependency list that allow the evaluator to reproduce the demonstration.
- ☐ Revised responsibility matrix and completion plan for Review 3.
- ☐ Contribution log supported by commits, files, test artefacts, diagrams or recorded technical outputs.
- ☐ Backup copy of code and presentation in case of local system or network failure.

8. Review 2 Evaluator Record

Criterion	Maximum	Marks Awarded	Evaluator Remarks
Review 1 corrections and progress against plan	1.0		
Core module implementation and technical depth	2.5		
Integration and functional prototype	1.5		
Testing, debugging and correctness evidence	1.5		
Code quality, repository and documentation	1.0		
Completion plan and risk handling	0.5		
Demonstration, presentation, contribution and viva	2.0		
Total	**10.0**		

Overall Review 2 Decision: ☐ On track for final review ☐ On track with corrections ☐ Major implementation revision required

Corrections / Mandatory Action Items before Review 3:
